

Network Automation with Salt and NAPALM

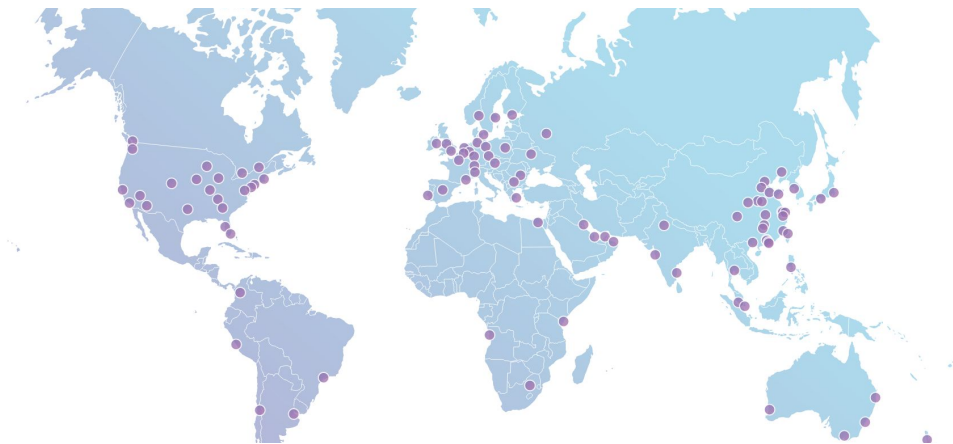

A self-resilient network

Mircea Ulinic
Cloudflare, London

APRICOT 2017
Ho Chi Minh City, VN

Cloudflare (a quick background)

- Once a website is part of the Cloudflare community, its web traffic is routed through our global network of 100+ locations
- How big?
 - Four+ million zones/domains
 - Authoritative for ~40% of Alexa top 1 million
 - 43+ billion DNS queries/day
 - Second only to Verisign
- 100+ anycast locations globally
 - 49 countries (and growing)
- Origin CA

Why automate?

- Deploy new PoPs
- Human error factor
- Replace equipment
- Monitor
- Much faster recovery

Automation framework requirements

- Very scalable
- Concurrency
- Easily configurable & customizable
- Config verification & enforcement
- Periodically collect statistics
- Native caching and drivers for useful tools

Why Salt?

Orchestration vs. Automation

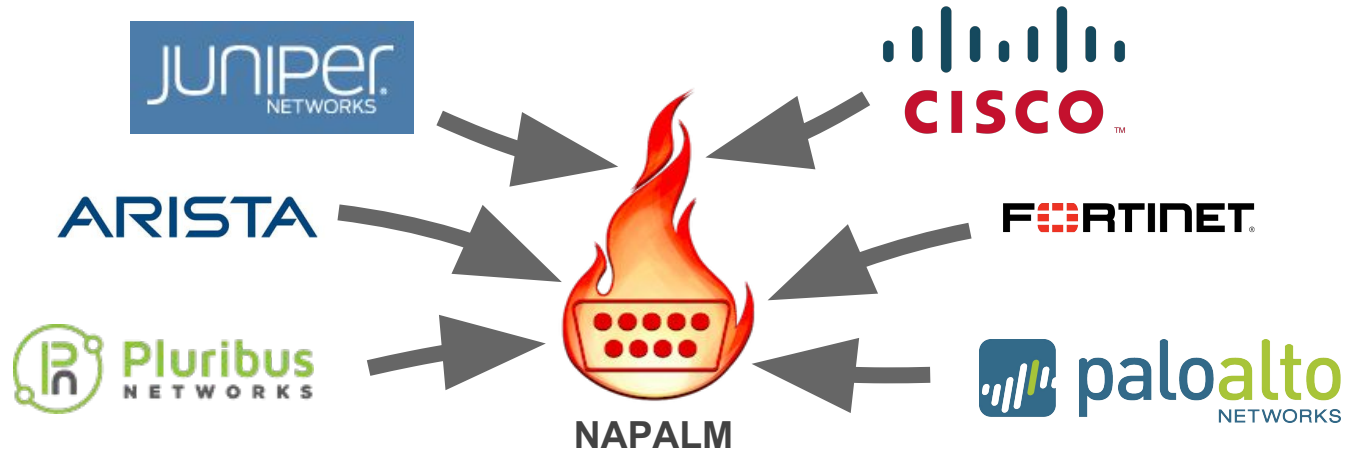

CC BY 2.0 <https://flic.kr/p/5EQe2d>

Orchestrator E.g.: Salt	Configuration management only E.g.: Ansible
<ul style="list-style-type: none">● Long standing sessions● Real-time job● Job scheduling● REST API● High Availability● GPG encryption● Pull from Git, SVN	<ul style="list-style-type: none">● open/close session per module● Real-time job (Tower: \$\$)● Job Scheduling (Tower: \$\$)● REST API (Ansible Tower: \$\$)● HA (Ansible Tower: \$\$)● Security (Tower: \$\$)● Pull from Git, SVN (Tower, \$\$)

Salt at Cloudflare: used for years

Multiple thousands of servers managed by Salt
Same tool for both servers and net devices

Why NAPALM?

(Network Automation and Programmability Abstraction Layer with Multivendor support)

<https://github.com/napalm-automation>

NAPALM integrated in SaltStack

NETWORK AUTOMATION: NAPALM

Beginning with 2016.11.0, network automation is included by default in the core of Salt. It is based on the [NAPALM](#) library and provides facilities to manage the configuration and retrieve data from network devices running widely used operating systems such as: JunOS, IOS-XR, eOS, IOS, NX-OS etc. - see [the complete list of supported devices](#).

The connection is established via the `NAPALM proxy`.

In the current release, the following modules were included:

- `NAPALM grains` - Select network devices based on their characteristics
- `NET execution module` - Networking basic features
- `NTP execution module`
- `BGP execution module`
- `Routes execution module`
- `SNMP execution module`
- `Users execution module`
- `Probes execution module`
- `NTP peers management state`
- `SNMP configuration management state`
- `Users management state`

<https://docs.saltstack.com/en/develop/topics/releases/2016.11.0.html>

Network automation in two steps

1. Install
2. Use

NAPALM-Salt (examples):

1. salt *“edge*”* net.**traceroute** 8.8.8.8
2. salt *-N EU* transit.**disable** telia # disable Telia in EU
3. salt *-G “os:junos”* net.**cli** “show version”
4. salt *-C “os:iosxr and version:6.0.2”* net.**arp**
5. salt *-G “model:MX480”* probes.**results**
6. salt *-I “type:router”* ntp.**set_peers** 10.1.130.10
10.1.130.18 10.1.130.22

Abstracting configurations

```
protocols {
  bgp {
    group 4-PUBLIC-ANYCAST-PEERS {
      neighbor 192.168.0.1 {
        description "Amazon [WW HOSTING ANYCAST]";
        family inet {
          unicast {
            prefix-limit {
              maximum 500;
            }
          }
        }
        peer-as 16509;
      }
    }
  }
}
```

```
router bgp 13335
  neighbor 192.168.0.1
    remote-as 16509
    use neighbor-group 4-PUBLIC-ANYCAST-PEERS
    description "Amazon [WW HOSTING ANYCAST]"
    address-family ipv4 unicast
    maximum-prefix 500
```

Abstracted

```
bgp.neighbor:
  ip: 192.168.0.1
  group: 4-PUBLIC-ANYCAST-PEERS
  description: "Amazon [WW HOSTING ANYCAST]"
  remote_as: 16509
  prefix_limit: 500
```

Example

- Edge router with 1000 BGP peers
- Device is manufactured by *VendorA*
- Replaced by a device from *VendorB*

Most network engineers

Us

```
vi /etc/salt/pillar/edge01_sgn01.sls
```

```
proxy:  
  driver: VendorA  
  proxytype: napalm  
  host: edge01.sgn01  
  username: apricot  
  passwd: xxxx
```

```
proxy:  
  driver: VendorB  
  proxytype: napalm  
  host: edge01.sgn01  
  username: apricot  
  passwd: xxxx
```

Scheduled operations - all integrated!

```
# Redis details:
redis.host: localhost
redis.port: 6379

# Schedulers
schedule:
  traceroute_runner:
    function: traceroute.collect
    hours: 4
```

```
2071) "traceroute:edge01.sjc01-edge01.lhr01-Tata-4"
2072) "traceroute:edge01.iad02-edge01.sjc01-GTT-4"
2074) "traceroute:edge01.fra03-edge01.sea01-Cogent-4"
2075) "traceroute:edge01.yul01-edge01.lax01-Cogent-4"
2076) "traceroute:edge01.zrh01-edge01.fra03-GTT-4"
2077) "traceroute:edge01.mxp01-edge01.ams01-GTT-4"
2078) "traceroute:edge01.mia01-edge01.lhr01-GTT-4"
2079) "traceroute:edge01.msp01-edge01.scl01-Telefonica-4"
2080) "traceroute:edge01.fra03-edge01.mia01-Telia-4"
2081) "traceroute:edge01.lim01-edge01.scl01-Telefonica-4"
2082) "traceroute:edge01.arn01-edge01.mia01-GTT-4"
2083) "traceroute:edge01.prg01-edge01.lax01-GTT-4"
2084) "traceroute:edge01.osl01-edge01.lhr01-GTT-4"
```

Maintain configuration updated

Define NTP peers in the Pillar

```
ntp.peers:  
- 10.1.130.22  
- 10.1.130.18  
- 10.1.128.10  
- 10.1.131.10  
- 10.1.132.10  
- 10.2.52.10  
- 10.2.48.10  
- 10.2.55.10  
- 10.2.50.10  
- 10.2.56.10
```

Schedule config enforcement checks

```
schedule:  
  ntp_config:  
    function: state.sls  
    args: router.ntp  
    returner: smtp  
    days: 1  
  bgp_config:  
    function: state.sls  
    args: router.bgp  
    hours: 2  
  probes_config:  
    function: state.sls  
    args: router.probes  
    days: 3  
  users_config:  
    function: state.sls  
    args: router.users  
    returner: hipchat  
    weeks: 1
```

Results for interface ge-0/1/1

Index	Interface	Interface Description	UP	Enabled	Speed (Max)	MAC Address	IP Address
1	ge-0/1/1	GE0/1/1 (Type:1000) (440000)	True	True	1000	98-4C-27-08-00-70	--- Not displayed --- --- Not displayed --- --- Not displayed ---

A self-resilient network

Monitoring carriers (transit providers)

```
mircea@re0.edge01.sgn01> show configuration services rpm | display set | match 1299 | match probe-type
set services rpm probe transit test t-edge01.scl01-1299-12956-4 probe-type icmp-ping
set services rpm probe transit test t-edge01.eze01-1299-6762-4 probe-type icmp-ping
set services rpm probe transit test t-edge01.lax01-1299-1299-4 probe-type icmp-ping
set services rpm probe transit test t-edge01.eze01-1299-12956-4 probe-type icmp-ping
set services rpm probe transit test t-edge01.mia01-1299-1299-4 probe-type icmp-ping
set services rpm probe transit test t-edge01.lhr01-1299-1299-4 probe-type icmp-ping
set services rpm probe transit test t-edge01.ams01-1299-1299-4 probe-type icmp-ping
set services rpm probe transit test t-edge01.fra03-1299-1299-4 probe-type icmp-ping
set services rpm probe transit test t-edge01.iad02-1299-1299-4 probe-type icmp-ping
set services rpm probe transit test t-edge01.sea01-1299-1299-4 probe-type icmp-ping
```

JunOS: RPM

https://www.juniper.net/documentation/en_US/junos12.1x46/topics/concept/security-rpm-overview.html

IOS-XR: ISPLA

http://www.cisco.com/c/en/us/td/docs/ios/ipsla/command/reference/sla_book/sla_02.html

How many probes?

```
$ sudo salt-run transits.probes show_count=True
```

```
Generated 7248 probes.
```

Generated using:

- [net.ipaddrs](#)
- [net.interfaces](#)
- [bgp.neighbors](#)
- [bgp.config](#)

All integrated by default in SaltStack.

How are they installed?

```
$ cat /etc/salt/pillar/probes_edge01_sgn01.sls
probes.config:
  transit:
    t-edge01.sjc01-1299-1299-4:
      source: 1.2.3.4

The Internet (during a good day)

But usually the Internet looks like that

Self-resilient network

Self-resilient network: HipChat alerts

event-action-script · Sep-30 07:37

Cogent: Disabled in EU

Current alerts per router:

Routers and their active alerts on transit:

edge01.cdg01: 5

edge01.otp01: 5

edge01.man01: 5

edge01.sof01: 5

netperf · Oct-5 10:36

[netperf] Anycast disabled on edge01.mde01

event-action-script · Oct-1 17:26

Comcast: Disabled in NA

Current alerts per router:

Routers and their active alerts on transit:

edge01.dfw01: 3

edge01.bos01: 6

edge01.den01: 4

edge01.phl01: 4

edge01.atl01: 2

How often?

1688 request-reply pairs during a random window of 7 days
~ 120 config changes / day in average
0 human intervention

How can you use it?

```
# apt-get install salt-master (install guide)
```

```
# pip install napalm
```

Examples:
